Part I
Overall Perspective

1 The Brain and Behavior ................. 5
Eric R. Kandel, A. J. Hudspeth
Two Opposing Views Have Been Advanced on the Relationship Between Brain and Behavior 6
The Brain Has Distinct Functional Regions 9
The First Strong Evidence for Localization of Cognitive Abilities Came from Studies of Language Disorders 10
Affective States Are Also Mediated by Local, Specialized Systems in the Brain 16
Mental Processes Are the End Product of the Interactions Between Elementary Processing Units in the Brain 17
Selected Readings 18
References 19

2 Nerve Cells, Neural Circuitry, and Behavior ......................... 21
Eric R. Kandel, Ben A. Barres, A. J. Hudspeth
The Nervous System Has Two Classes of Cells 22
Nerve Cells Are the Signaling Units of the Nervous System 22
Glial Cells Support Nerve Cells 24
Each Nerve Cell Is Part of a Circuit That Has One or More Specific Behavioral Functions 27
Signaling Is Organized in the Same Way in All Nerve Cells 29
The Input Component Produces Graded Local Signals 31
The Trigger Zone Makes the Decision to Generate an Action Potential 31
The Conductive Component Propagates an All-or-None Action Potential 33
The Output Component Releases Neurotransmitter 35
The Transformation of the Neural Signal from Sensory to Motor Is Illustrated by the Stretch-Reflex Pathway 35
Nerve Cells Differ Most at the Molecular Level 35
Neural Network Models Simulate the Brain’s Parallel Processing of Information 36
Neural Connections Can Be Modified by Experience 37
Selected Readings 38
References 38

3 Genes and Behavior ...................... 39
Cornelia I. Bargmann, T. Conrad Gilliam
Genes, Genetic Analysis, and Heritability in Behavior 41
The Nature of the Gene 41
Genes Are Arranged on Chromosomes 42
The Relationship Between Genotype and Phenotype 43
Genes Are Conserved Through Evolution 45
The Role of Genes in Behavior Can Be Studied in Animal Models 46
Circadian Rhythm Is Generated by a Transcriptional Oscillator in Flies, Mice, and Humans 47
Natural Variation in a Protein Kinase Regulates Activity in Flies and Honeybees 52
The Social Behaviors of Several Species Are Regulated by Neuropeptide Receptors 54
Genetic Studies of Human Behavior and Its Abnormalities 55
Neurological Disorders in Humans Suggest That Distinct Genes Affect Different Brain Functions 57
Autism-Related Disorders Exemplify the Complex Genetic Basis of Behavioral Traits 57
Psychiatric Disorders and the Challenge of Understanding Multigenic Traits 58
Complex Inheritance and Genetic Imprinting in Human Genetics 58
Multigenic Traits: Many Rare Diseases or a Few Common Variants? 59
An Overall View 62
Glossary 63
Selected Readings 64
References 64

Part II
Cell and Molecular Biology of the Neuron

4 The Cells of the Nervous System . . . . 71
Steven A. Siegelbaum, John Koester
Neurons and Glia Share Many Structural and Molecular Characteristics 71
The Cytoskeleton Determines Cell Shape 74
Protein Particles and Organelles Are Actively Transported Along the Axon and Dendrites 79
Fast Axonal Transport Carries Membranous Organelles 80
Slow Axonal Transport Carries Cytosolic Proteins and Elements of the Cytoskeleton 83
Proteins Are Made in Neurons as in Other Secretory Cells 84
Secretory and Membrane Proteins Are Synthesized and Modified in the Endoplasmic Reticulum 84
Secretory Proteins Are Modified in the Golgi Complex 86
Surface Membrane and Extracellular Substances Are Recycled in the Cell 87
Glial Cells Play Diverse Roles in Neural Function 88
Glia Form the Insulating Sheaths for Axons 88
Astrocytes Support Synaptic Signaling 88
Choroid Plexus and Ependymal Cells Produce Cerebrospinal Fluid 95
Microglia in the Brain Are Derived from Bone Marrow 95
An Overall View 96

5 Ion Channels ......................... 100
Steven A. Siegelbaum, John Koester
Rapid Signaling in the Nervous System Depends on Ion Channels 101
Ion Channels Are Proteins That Span the Cell Membrane 101
Currents Through Single Ion Channels Can Be Recorded 104
Ion Channels in All Cells Share Several Characteristics 107
The Flux of Ions Through a Channel Is Passive 107
The Opening and Closing of a Channel Involve Conformational Changes 108
The Structure of Ion Channels Is Inferred from Biophysical, Biochemical, and Molecular Biological Studies 110
Ion Channels Can Be Grouped into Gene Families 113
The Closed and Open Structures of Potassium Channels Have Been Resolved by X-Ray Crystallography 116
The Structural Basis of Chloride Selectivity Reveals a Close Relation Between Ion Channels and Ion Transporters 119
An Overall View 123
Selected Readings 124
References 124

6 Membrane Potential and the Passive Electrical Properties of the Neuron . . 126
John Koester, Steven A. Siegelbaum
The Resting Membrane Potential Results from the Separation of Charge Across the Cell Membrane 127
The Resting Membrane Potential Is Determined by Nongated and Gated Ion Channels 127
Open Channels in Glial Cells Are Permeable to Potassium Only 129
Open Channels in Resting Nerve Cells Are Permeable to Several Ion Species 130
The Electrochemical Gradients of Sodium, Potassium, and Calcium Are Established by Active Transport of the Ions 131
Chloride Ions Are Also Actively Transported 134
The Balance of Ion Fluxes That Maintains the Resting Membrane Potential Is Abolished During the Action Potential 134
The Contributions of Different Ions to the Resting Membrane Potential Can Be Quantified by the Goldman Equation 135

Selected Readings 97
References 98
The Functional Properties of the Neuron Can Be Represented as an Electrical Equivalent Circuit 135
The Passive Electrical Properties of the Neuron Affect Electrical Signaling 138

Membrane Capacitance Slows the Time Course of Electrical Signals 139
Membrane and Axoplasmic Resistance Affect the Efficiency of Signal Conduction 142
Large Axons Are More Easily Excited Than Small Axons 143
Passive Membrane Properties and Axon Diameter Affect the Velocity of Action Potential Propagation 144

An Overall View 145
Selected Readings 147
References 147

7 Propagated Signaling: The Action Potential 148

John Koester, Steven A. Siegelbaum
The Action Potential Is Generated by the Flow of Ions Through Voltage-Gated Channels 149
Sodium and Potassium Currents Through Voltage-Gated Channels Are Recorded with the Voltage Clamp 149
Voltage-Gated Sodium and Potassium Conductances Are Calculated from Their Currents 153
The Action Potential Can Be Reconstructed from the Properties of Sodium and Potassium Channels 156
Variations in the Properties of Voltage-Gated Ion Channels Expand the Signaling Capabilities of Neurons 158
The Nervous System Expresses a Rich Variety of Voltage-Gated Ion Channels 158
Gating of Voltage-Sensitive Ion Channels Can Be Influenced by Various Cytoplasmic Factors 159
Excitability Properties Vary Between Regions of the Neuron 159
Excitability Properties Vary Between Types of Neurons 160

The Mechanisms of Voltage-Gating and Ion Permeation Have Been Inferred from Electrophysiological Measurements 162
Voltage-Gated Sodium Channels Open and Close in Response to Redistribution of Charges Within the Channel 162
Voltage-Gated Sodium Channels Select for Sodium on the Basis of Size, Charge, and Energy of Hydration of the Ion 164

Voltage-Gated Potassium, Sodium, and Calcium Channels Stem from a Common Ancestor and Have Similar Structures 164
X-Ray Crystallographic Analysis of Voltage-Gated Channel Structures Provides Insight into Voltage-Gating 166
The Diversity of Voltage-Gated Channel Types Is Generated by Several Genetic Mechanisms 167

An Overall View 170
Selected Readings 170
References 171

Part III
Synaptic Transmission

8 Overview of Synaptic Transmission 177

Steven A. Siegelbaum, Eric R. Kandel
Synapses Are Either Electrical or Chemical 177
Electrical Synapses Provide Instantaneous Signal Transmission 178
Cells at an Electrical Synapse Are Connected by Gap-Junction Channels 180
Electrical Transmission Allows the Rapid and Synchronous Firing of Interconnected Cells 183
Gap Junctions Have a Role in Glial Function and Disease 184

Chemical Synapses Can Amplify Signals 184
Neurotransmitters Bind to Postsynaptic Receptors 185
Postsynaptic Receptors Gate Ion Channels Either Directly or Indirectly 186

Selected Readings 187
References 188

9 Signaling at the Nerve-Muscle Synapse: Directly Gated Transmission 189

Eric R. Kandel, Steven A. Siegelbaum
The Neuromuscular Junction Is a Well-Studied Example of Directly Gated Synaptic Transmission 189
The Motor Neuron Excites the Muscle by Opening Ligand-Gated Ion Channels at the End-Plate 191
The End-Plate Potential Is Produced by Ionic Current Through Acetylcholine Receptor-Channels 192
The Ion Channel at the End-Plate Is Permeable to Both Sodium and Potassium 193

Selected Readings 197
References 198
The Current Through Single Acetylcholine Receptor-Channels Can Be Measured Using the Patch Clamp 195

Individual Receptor-Channels Conduct All-or-None Unitary Currents 195

Four Factors Determine the End-Plate Current 198

The Molecular Properties of the Acetylcholine Receptor-Channel Are Known 199

An Overall View 203

Postscript: The End-Plate Current Can Be Calculated from an Equivalent Circuit 205

Selected Readings 208

References 208

10 Synaptic Integration in the Central Nervous System ........... 210

Steven A. Siegelbaum, Eric R. Kandel, Rafael Yuste

Central Neurons Receive Excitatory and Inhibitory Inputs 211

Excitatory and Inhibitory Synapses Have Distinctive Ultrastructures 211

Excitatory Synaptic Transmission Is Mediated by Ionotropic Glutamate Receptor-Channels That Are Permeable to Sodium and Potassium 213

The Excitatory Ionotropic Glutamate Receptors Are Encoded by a Distinct Gene Family 215

Glutamate Receptors Are Constructed from a Set of Modules 218

NMDA and AMPA Receptors Are Organized by a Network of Proteins at the Postsynaptic Density 220

Inhibitory Synaptic Action Is Usually Mediated by Ionotropic GABA and Glycine Receptor-Channels That Are Permeable to Chloride 222

Currents Through Single GABA and Glycine Receptor-Channels Can Be Recorded 223

Chloride Currents Through Inhibitory GABA, and Glycine Receptor-Channels Normally Inhibit the Postsynaptic Cell 225

Ionotropic Glutamate, GABA, and Glycine Receptors Are Transmembrane Proteins Encoded by Two Distinct Gene Families 226

Ionotropic GABA, and Glycine Receptors Are Homologous to Nicotinic ACh Receptors 226

Some Synaptic Actions Depend on Other Types of Ionotropic Receptors in the Central Nervous System 227

Excitatory and Inhibitory Synaptic Actions Are Integrated by the Cell into a Single Output 227

Synaptic Inputs Are Integrated to Fire an Action Potential at the Axon Initial Segment 227

Dendrites Are Electrically Excitable Structures That Can Fire Action Potentials 228

Synapses on a Central Neuron Are Grouped According to Physiological Function 230

An Overall View 232

Selected Readings 234

References 235

11 Modulation of Synaptic Transmission: Second Messengers............. 236

Steven A. Siegelbaum, David E. Clapham, James H. Schwartz

The Cyclic AMP Pathway Is the Best Understood Second-Messenger Signaling Cascade Initiated by G Protein-Coupled Receptors 237

The Second-Messenger Pathways Initiated by G Protein-Coupled Receptors Share a Common Molecular Logic 240

A Family of G Proteins Activates Distinct Second-Messenger Pathways 240

Hydrolysis of Phospholipids by Phospholipase C Produces Two Important Second Messengers, IP3 and Diacylglycerol 242

Hydrolysis of Phospholipids by Phospholipase A2 Liberates Arachidonic Acid to Produce Other Second Messengers 245

Transcellular Messengers Are Important for Regulating Presynaptic Function 247

Endocannabinoids Are Derived from Arachidonic Acid 247

The Gaseous Second Messengers, Nitric Oxide and Carbon Monoxide, Stimulate Cyclic GMP Synthesis 247

A Family of Receptor Tyrosine Kinases Mediates Some Metabotropic Receptor Effects 248

The Physiological Actions of Ionotropic and Metabotropic Receptors Differ 250

Second-Messenger Cascades Can Increase or Decrease the Opening of Many Types of Ion Channels 250

G Proteins Can Modulate Ion Channels Directly 253

Cyclic AMP-Dependent Protein Phosphorylation Can Close Potassium Channels 255

Synaptic Actions Mediated by Phosphorylation Are Terminated by Phosphoprotein Phosphatases 255
13 Neurotransmitters .................. 289
James H. Schwartz, Jonathan A. Javitch
A Chemical Messenger Must Meet Four Criteria to Be Considered a Neurotransmitter 289
Only a Few Small-Molecule Substances Act as Transmitters 290
Acetylcholine 291
Biogenic Amine Transmitters 291
Catecholamine Transmitters 291
Serotonin 293
Histamine 294
Amino Acid Transmitters 294
ATP and Adenosine 294
Small-Molecule Transmitters Are Actively Taken Up into Vesicles 295
Many Neuroactive Peptides Serve as Transmitters 297
Peptides and Small-Molecule Transmitters Differ in Several Ways 300
Peptides and Small-Molecule Transmitters Coexist and Can Be Co-released 300
Removal of Transmitter from the Synaptic Cleft Terminates Synaptic Transmission 301
An Overall View 304
Selected Readings 305
References 305

14 Diseases of the Nerve and Motor Unit .................. 307
Robert H. Brown, Stephen C. Cannon, Lewis P. Rowland
Disorders of the Peripheral Nerve, Neuromuscular Junction, and Muscle Can Be Distinguished Clinically 308
A Variety of Diseases Target Motor Neurons and Peripheral Nerves 309
Motor Neuron Diseases Do Not Affect Sensory Neurons 309
Diseases of Peripheral Nerves Affect Conduction of the Action Potential 310
The Molecular Bases of Some Inherited Peripheral Neuropathies Have Been Defined 311
Diseases of the Neuromuscular Junction Have Multiple Causes 312
Myasthenia Gravis Is the Best Studied Example of a Neuromuscular Junction Disease 314

12 Transmitter Release ............... 260
Steven A. Siegelbaum, Eric R. Kandel, Thomas C. Südhof
Transmitter Release Is Regulated by Depolarization of the Presynaptic Terminal 260
Release Is Triggered by Calcium Influx 263
The Relation Between Presynaptic Calcium Concentration and Release 265
Several Classes of Calcium Channels Mediate Transmitter Release 265
Transmitter Is Released in Quantal Units 267
Transmitter Is Stored and Released by Synaptic Vesicles 268
Synaptic Vesicles Discharge Transmitter by Exocytosis and Are Recycled by Endocytosis 271
Capacitance Measurements Provide Insight into the Kinetics of Exocytosis and Endocytosis 272
Exocytosis Involves the Formation of a Temporary Fusion Pore 272
The Synaptic Vesicle Cycle Involves Several Steps 275
Exocytosis of Synaptic Vesicles Relies on a Highly Conserved Protein Machinery 278
The Synapsins Are Important for Vesicle Restraint and Mobilization 278
SNARE Proteins Catalyze Fusion of Vesicles with the Plasma Membrane 278
Calcium Binding to Synaptotagmin Triggers Transmitter Release 280
The Fusion Machinery Is Embedded in a Conserved Protein Scaffold at the Active Zone 281
Modulation of Transmitter Release Underlies Synaptic Plasticity 281
Activity-Dependent Changes in Intracellular Free Calcium Can Produce Long-Lasting Changes in Release 283
Axo-axonic Synapses on Presynaptic Terminals Regulate Transmitter Release 285
An Overall View 285
Selected Readings 287
References 287
Many Specialized Receptors Are Employed by the Somatosensory System 479

Mechanoreceptors Mediate Touch and Proprioception 480

Proprioceptors Measure Muscle Activity and Joint Positions 482

Nociceptors Mediate Pain 485

Thermal Receptors Detect Changes in Skin Temperature 485

Itch Is a Distinctive Cutaneous Sensation 486

Visceral Sensations Represent the Status of Various Internal Organs 487

Somatosensory Information Enters the Central Nervous System Through Cranial and Spinal Nerves 488

Somatosensory Information Flows from the Spinal Cord to the Thalamus Through Parallel Pathways 488

The Dorsal Column–Medial Lemniscal System Relays Tactile and Proprioceptive Information 491

The Spinothalamic System Conveys Noxious, Thermal, and Visceral Information 492

The Thalamus Has a Number of Specialized Somatosensory Regions 494

The Ventral Posterior Nucleus Relays Tactile and Proprioceptive Information 494

Noxious, Thermal, and Visceral Information Is Processed in Several Thalamic Nuclei 494

An Overall View 495

Selected Readings 495

References 496

23 Touch 498

Active and Passive Touch Evoke Similar Responses in Mechanoreceptors 499

The Hand Has Four Types of Mechanoreceptors 499

Receptive Fields Define the Zone of Tactile Sensitivity 502

Two-Point Discrimination Tests Measure Texture Perception 504

Slowly Adapting Fibers Detect Object Pressure and Form 504

Rapidly Adapting Fibers Detect Motion and Vibration 508

30 The Inner Ear ......................654
A. J. Hudspeth
The Ear Has Three Functional Parts 655
Hearing Commences with the Capture of Sound Energy by the Ear 656
The Hydrodynamic and Mechanical Apparatus of the Cochlea Delivers Mechanical Stimuli to the Receptor Cells 659
The Basilar Membrane Is a Mechanical Analyzer of Sound Frequency 659
The Organ of Corti Is the Site of Mechanoelectrical Transduction in the Cochlea 660
Hair Cells Transform Mechanical Energy into Neural Signals 664
Deflection of the Hair Bundle Initiates Mechanoelectrical Transduction 664
Mechanical Force Directly Opens Transduction Channels 665
Direct Mechanoelectrical Transduction Is Rapid 666
The Temporal Responsiveness of Hair Cells Determines Their Sensitivity 667
Hair Cells Adapt to Sustained Stimulation 668
Hair Cells Are Tuned to Specific Stimulus Frequencies 669
Sound Energy Is Mechanically Amplified in the Cochlea 671
Hair Cells Use Specialized Ribbon Synapses 674

Auditory Information Flows Initially Through the Cochlear Nerve 675
Bipolar Neurons in the Spiral Ganglion Innervate Cochlear Hair Cells 675
Cochlear Nerve Fibers Encode Stimulus Frequency and Intensity 676
Sensorineural Hearing Loss Is Common but Treatable 678
An Overall View 678
Selected Readings 680
References 680

31 The Auditory Central Nervous System .......................682
Donata Oertel, Allison J. Doupe
Multiple Types of Information Are Present in Sounds 683
The Neural Representation of Sound Begins in the Cochlear Nuclei 684
The Cochlear Nerve Imposes a Tonotopic Organization on the Cochlear Nuclei and Distributes Acoustic Information into Parallel Pathways 686
The Ventral Cochlear Nucleus Extracts Information About the Temporal and Spectral Structure of Sounds 686
The Dorsal Cochlear Nucleus Integrates Acoustic with Somatosensory Information in Making Use of Spectral Cues for Localizing Sounds 690
The Superior Olivary Complex of Mammals Contains Separate Circuits for Detecting Interaural Time and Intensity Differences 690
The Medial Superior Olive Generates a Map of Interaural Time Differences 690
The Lateral Superior Olive Detects Interaural Intensity Differences 691
Efferent Signals from the Superior Olivary Complex Provide Feedback to the Cochlea 693
Brain Stem Pathways Converge in the Inferior Colliculus 694
Sound Location Information from the Inferior Colliculus Creates a Spatial Map of Sound in the Superior Colliculus 695
Midbrain Sound-Localization Pathways Are Sensitive to Experience in Early Life 697
The Inferior Colliculus Transmits Auditory Information to the Cerebral Cortex 700
The Auditory Cortex Maps Numerous Aspects of Sound 700
Auditory Information Is Processed in Multiple Cortical Areas 701
Insectivorous Bats Have Cortical Areas Specialized for Behaviorally Relevant Features of Sound 701
A Second Sound-Localization Pathway from the Inferior Colliculus Involves the Cerebral Cortex in Gaze Control 703
Auditory Circuits in the Cerebral Cortex Are Segregated into Separate Processing Streams 704
The Cerebral Cortex Modulates Processing in Subcortical Auditory Areas 705

Hearing Is Crucial for Vocal Learning and Production in Both Humans and Songbirds 705
Normal Vocal Behavior Cannot Be Learned in Isolation 705
Vocal Learning Is Optimal During a Sensitive Period 707
Both Humans and Songbirds Possess Specialized Neural Networks for Vocalization 707
Songbirds Have Feature Detectors for Learned Vocalizations 708

An Overall View 710
Selected Readings 710
References 711

32 Smell and Taste: The Chemical Senses 712
Linda B. Buck, Cornelia I. Bargmann
A Large Number of Olfactory Receptor Proteins Initiate the Sense of Smell 713
Mammals Share a Large Family of Odorant Receptors 714
Different Combinations of Receptors Encode Different Odorants 715
Olfactory Information Is Transformed Along the Pathway to the Brain 716
Odorants Are Encoded in the Nose by Dispersed Neurons 716
Sensory Inputs in the Olfactory Bulb Are Arranged by Receptor Type 717
The Olfactory Bulb Transmits Information to the Olfactory Cortex 720
Output from the Olfactory Cortex Reaches Higher Cortical and Limbic Areas 721
Olfactory Acuity Varies in Humans 721

Odors Elicit Characteristic Innate Behaviors 721
Pheromones Are Detected in Two Olfactory Structures 721
Invertebrate Olfactory Systems Can Be Used to Study Odor Coding and Behavior 722
The Anatomy of the Insect Olfactory System Resembles That of Vertebrates 722
Olfactory Cues Elicit Stereotyped Behaviors and Physiological Responses in the Nematode 724
Strategies for Olfaction Have Evolved Rapidly 725

The Gustatory System Controls the Sense of Taste 726
Taste Has Five Submodalities or Qualities 726
Taste Detection Occurs in Taste Buds 727
Each Taste Is Detected by a Distinct Sensory Transduction Mechanism and Distinct Population of Taste Cells 728
Sensory Neurons Carry Taste Information from the Taste Buds to the Brain 732
Taste Information Is Transmitted from the Thalamus to the Gustatory Cortex 732
Perception of Flavor Depends on Gustatory, Olfactory, and Somatosensory Inputs 733
Insect Taste Organs Are Distributed Widely on the Body 733

An Overall View 733

Part VI
Movement

33 The Organization and Planning of Movement 743
Daniel M. Wolpert, Keir G. Pearson, Claude P.J. Ghez
Motor Commands Arise Through Sensorimotor Transformations 744
The Central Nervous System Forms Internal Models of Sensorimotor Transformations 746
Movement Inaccuracies Arise from Errors and Variability in the Transformations 748
Different Coordinate Systems May Be Employed at Different Stages of Sensorimotor Transformations 749
Stereotypical Patterns Are Employed in Many Movements 750
Motor Signals Are Subject to Feedforward and Feedback Control 753
Feedforward Control Does Not Use Sensory Feedback 754
Feedback Control Uses Sensory Signals to Correct Movements 756
Prediction Compensates for Sensorimotor Delays 756
Sensory Processing Is Different for Action and Perception 760
Motor Systems Must Adapt to Development and Experience 761
Motor Learning Involves Adapting Internal Models for Novel Kinematic and Dynamic Conditions 763
Kinematic and Dynamic Motor Learning Rely on Different Sensory Modalities 763
An Overall View 766
Selected Readings 766
References 766

34 The Motor Unit and Muscle Action 768
Roger M. Enoka, Keir G. Pearson
The Motor Unit Is the Elementary Unit of Motor Control 768
A Motor Unit Consists of a Motor Neuron and Multiple Muscle Fibers 768
The Properties of Motor Units Vary 770
Physical Activity Can Alter Motor Unit Properties 772
Muscle Force Is Controlled by the Recruitment and Discharge Rate of Motor Units 773
The Input–Output Properties of Motor Neurons Are Modified by Input from the Brain Stem 774
Muscle Force Depends on the Structure of Muscle 776
The Sarcomere Contains the Contractile Proteins 776
Noncontractile Elements Provide Essential Structural Support 777
Contractile Force Depends on Muscle Fiber Activation, Length, and Velocity 777
Muscle Torque Depends on Musculoskeletal Geometry 780
Different Movements Require Different Activation Strategies 783
Contraction Velocity Can Vary in Magnitude and Direction 783

35 Spinal Reflexes 790
Keir G. Pearson, James E. Gordon
Reflexes Are Adaptable to Particular Motor Tasks 791
Spinal Reflexes Produce Coordinated Patterns of Muscle Contraction 792
Cutaneous Reflexes Produce Complex Movements That Serve Protective and Postural Functions 792
The Stretch Reflex Resists the Lengthening of a Muscle 792
Local Spinal Circuits Contribute to the Coordination of Reflex Responses 796
The Stretch Reflex Involves a Monosynaptic Pathway 796
Ia Inhibitory Interneurons Coordinate the Muscles Surrounding a Joint 797
Divergence in Reflex Pathways Amplifies Sensory Inputs and Coordinates Muscle Contractions 798
Convergence of Inputs on Ib Interneurons Increases the Flexibility of Reflex Responses 799
Central Motor Commands and Cognitive Processes Can Alter Synaptic Transmission in Spinal Reflex Pathways 799
Central Neurons Can Regulate the Strength of Spinal Reflexes at Three Sites in the Reflex Pathway 801
Gamma Motor Neurons Adjust the Sensitivity of Muscle Spindles 802
Proprioceptive Reflexes Play an Important Role in Regulating Both Voluntary and Automatic Movements 804
Muscles Involving Limb Muscles Are Mediated Through Spinal and Supraspinal Pathways 804
Stretch Reflexes Reinforce Central Commands for Movements 806
Damage to the Central Nervous System Produces Characteristic Alterations in Reflex Response and Muscle Tone 807
Interruption of Descending Pathways to the Spinal Cord Frequently Produces Spasticity 809
Transsection of the Spinal Cord in Humans Leads to a Period of Spinal Shock Followed by Hyperreflexia 809
Neurons in the Inferior Parietal Cortex Associate the Physical Properties of an Object with Specific Motor Acts 877
The Activity of Neurons of the Inferior Parietal Cortex Is Influenced by the Purpose of an Action 877
The Activity of Neurons in the Ventral Premotor Cortex Correlates with Motor Acts 878
The Primary Motor Cortex Transforms a Grasping Action Plan into Appropriate Finger Movements 882
The Supplementary Motor Complex Plays a Crucial Role in Selecting and Executing Appropriate Voluntary Actions 883
The Cortical Motor System Is Involved in Planning Action 884
Cortical Motor Areas Apply the Rules That Govern Behavior 884
The Premotor Cortex Contributes to Perceptual Decisions That Guide Motor Behavior 886
The Premotor Cortex Is Involved in Learning Motor Skills 888
Cortical Motor Areas Contribute to Understanding the Observed Actions of Others 888
The Relationship between Motor Acts, the Sense of Volition, and Free Will Is Uncertain 891
An Overall View 891
Selected Readings 892
References 892

39 The Control of Gaze 894
Michael E. Goldberg, Mark F. Walker
Six Neuronal Control Systems Keep the Eyes on Target 895
An Active Fixation System Keeps the Fovea on a Stationary Target 895
The Saccadic System Points the Fovea Toward Objects of Interest 895
The Smooth-Pursuit System Keeps Moving Targets on the Fovea 895
The Vergence System Aligns the Eyes to Look at Targets at Different Depths 896
The Eye Is Moved by the Six Extraocular Muscles 897
Eye Movements Rotate the Eye in the Orbit 897
The Six Extraocular Muscles Form Three Agonist–Antagonist Pairs 898
Movements of the Two Eyes Are Coordinated 899
The Extraocular Muscles Are Controlled by Three Cranial Nerves 899
Extraocular Motor Neurons Encode Eye Position and Velocity 901
The Motor Circuits for Saccades Lie in the Brain Stem 901
Horizontal Saccades Are Generated in the Pontine Reticular Formation 901
Vertical Saccades Are Generated in the Mesencephalic Reticular Formation 906
Brain Stem Lesions Result in Characteristic Deficits in Eye Movements 906
Saccades Are Controlled by the Cerebral Cortex Through the Superior Colliculus 906
The Superior Colliculus Integrates Visual and Motor Information into Oculomotor Signals to the Brain Stem 906
The Rostral Superior Colliculus Facilitates Visual Fixation 909
The Basal Ganglia Inhibit the Superior Colliculus 909
Two Regions of Cerebral Cortex Control the Superior Colliculus 909
The Control of Saccades Can Be Modified by Experience 912
Smooth Pursuit Involves the Cerebral Cortex, Cerebellum, and Pons 912
Some Gaze Shifts Require Coordinated Head and Eye Movements 913
An Overall View 914
Selected Readings 914
References 915

40 The Vestibular System 917
Michael E. Goldberg, Mark F. Walker, A. J. Hudspeth
The Vestibular Apparatus in the Inner Ear Contains Five Receptor Organs 917
Hair Cells Transduce Mechanical Stimuli into Receptor Potentials 919
The Semicircular Canals Sense Head Rotation 919
The Otolith Organs Sense Linear Accelerations 921
Most Movements Elicit Complex Patterns of Vestibular Stimulation 922
Vestibulo-Ocular Reflexes Stabilize the Eyes and Body When the Head Moves 922
The Rotational Vestibulo-Ocular Reflex Compensates for Head Rotation 923

50 Seizures and Epilepsy ............. 1116
Gary L. Westbrook

Classification of Seizures and the Epilepsies Is Important
for Pathogenesis and Treatment 1117

Seizures Are Temporary Disruptions of
Brain Function 1117

Epilepsy Is the Chronic Condition of
Recurrent Seizures 1118

The Electroencephalogram Represents the Collective
Behavior of Cortical Neurons 1119

Focal Seizures Originate Within a Small Group of
Neurons Known as a Seizure Focus 1119

Neurons in a Seizure Focus Have
Characteristic Activity 1121

The Breakdown of Surround Inhibition
Leads to Synchronization 1121
The Spread of Focal Seizures Involves Normal Cortical Circuitry 1124

Primary Generalized Seizures Are Driven by Thalamocortical Circuits 1128
Locating the Seizure Focus Is Critical to the Surgical Treatment of Epilepsy 1131
Prolonged Seizures Can Cause Brain Damage 1134
  Repeated Convulsive Seizures Are a Medical Emergency 1134
  Excitotoxicity Underlies Seizure-Related Brain Damage 1134
The Factors Leading to Development of Epilepsy Are an Unfolding Mystery 1135
  Among the Genetic Causes of Epilepsy Are Ion Channel Mutations 1135
  Epilepsies Involving Focal Seizures May Be a Maladaptive Response to Injury 1137

51 Sleep and Dreaming ................. 1140
David A. McCormick, Gary L. Westbrook

Sleep Consists of Alternating REM and Non-REM Periods 1141
  Non-REM Sleep Has Four Stages 1141
  REM and Non-REM Dreams Are Different 1141
Sleep Obeys Circadian and Ultradian Rhythms 1144
  The Circadian Rhythm Clock Is Based on a Cyclic Production of Nuclear Transcription Factors 1146
  The Ultradian Rhythm of Sleep Is Controlled by the Brain Stem 1147
  Sleep-Related Activity in the EEG Is Generated Through Local and Long-Range Circuits 1148
Sleep Changes with Age 1150
The Characteristics of Sleep Vary Greatly Between Species 1150
Sleep Disorders Have Behavioral, Psychological, and Neurological Causes 1151
  Insomnia Is the Most Common Form of Sleep Disruption 1151
  Excessive Daytime Sleepiness Is Indicative of Disrupted Sleep 1152
  The Disruption of Breathing During Sleep Apnea Results in Fragmentation of Sleep 1152
  Narcolepsy Is Characterized by Abnormal Activation of Sleep Mechanisms 1152
  Restless Leg Syndrome and Periodic Leg Movements Disrupt Sleep 1155
  Parasomnias Include Sleep Walking, Sleep Talking, and Night Terrors 1155
  Circadian Rhythm Sleep Disorders Are Characterized by an Activity Cycle That Is Out of Phase with the World 1156

53 **Differentiation and Survival of Nerve Cells** ................. 1187
Thomas M. Jessell, Joshua R. Sanes

The Proliferation of Neural Progenitor Cells Involves Symmetric and Asymmetric Modes of Cell Division 1187
Radial Glial Cells Serve As Neural Progenitors and Structural Scaffolds 1188
The Generation of Neurons or Glial Cells Is Regulated by Delta-Notch Signaling and Basic Helix-Loop-Helix Transcription Factors 1188
Neuronal Migration Establishes the Layered Organization of the Cerebral Cortex 1192
Central Neurons Migrate Along Glial Cells and Axons to Reach Their Final Settling Position 1194
Glia serve As a Scaffold in Radial Migration 1194
Axon Tracts Serve As a Scaffold for Tangential Migration 1194
Neural Crest Cell Migration in the Peripheral Nervous System Does Not Rely on Scaffolding 1197

The Neurotransmitter Phenotype of a Neuron Is Plastic 1199
The Transmitter Phenotype of a Peripheral Neuron Is Influenced by Signals from the Neuronal Target 1199
The Transmitter Phenotype of a Central Neuron Is Controlled by Transcription Factors 1199
The Survival of a Neuron Is Regulated by Neurotrophic Signals from the Neuronal Target 1200
The Neurotrophic Factor Hypothesis Was Confirmed by the Discovery of Nerve Growth Factor 1201
Neurotrophins Are the Best Studied Neurotrophic Factors 1202

Neurotrophic Factors Suppress a Latent Death Program in Cells 1205

An Overall View 1206
Selected Readings 1208
References 1208

54 **The Growth and Guidance of Axons** ......................... 1209
Joshua R. Sanes, Thomas M. Jessell

Differences in the Molecular Properties of Axons and Dendrites Emerge Early in Development 1209
Neuronal Polarity Is Established Through Rearrangements of the Cytoskeleton 1210
Dendrites Are Patterned by Intrinsic and Extrinsic Factors 1210

The Growth Cone Is a Sensory Transducer and a Motor Structure 1213
Molecular Cues Guide Axons to Their Targets 1218
The Growth of Retinal Ganglion Axons Is Oriented in a Series of Discrete Steps 1221
Growth Cones Diverge at the Optic Chiasm 1221
Ephrins Provide Gradients of Inhibitory Signals in the Brain 1224

Axons from Some Spinal Neurons Cross the Midline 1227
Netrins Direct Developing Commisural Axons Across the Midline 1227
Chemorepellent Factors Pattern the Midline 1229

An Overall View 1229
Selected Readings 1230
References 1231

55 **Formation and Elimination of Synapses** ..................... 1233
Joshua R. Sanes, Thomas M. Jessell

Recognition of Synaptic Targets Is Specific 1234
Recognition Molecules Promote Selective Synapse Formation 1234
Different Synaptic Inputs Are Directed to Discrete Domains of the Postsynaptic Cell 1236
Neural Activity Sharpens Synaptic Specificity 1237

Principles of Synaptic Differentiation Are Revealed at the Neuromuscular Junction 1239
Segregation of Retinal Inputs in the Lateral Geniculate Nucleus Is Driven by Spontaneous Neural Activity In Utero  1273
Activity-Dependent Refinement of Connections Is a General Feature of Circuits in the Central Nervous System  1274
  Many Aspects of Visual System Development Are Activity-Dependent  1274
  Auditory Maps Are Refined During a Critical Period  1275
  Distinct Regions of the Brain Have Different Critical Periods of Development  1277
Critical Periods Can Be Reopened in Adulthood  1278

57 Repairing the Damaged Brain  . . . . . . . . . . . .  1284
Joshua R. Sanes, Thomas M. Jessell
Damage to Axons Affects Neurons and Neighboring Cells  1285
  Axon Degeneration Is an Active Process  1285
  Axotomy Leads to Reactive Responses in Nearby Cells  1287
Central Axons Regenerate Poorly After Injury  1287
Therapeutic Interventions May Promote Regeneration of Injured Central Neurons  1289
  Environmental Factors Support the Regeneration of Injured Axons  1290
  Components of Myelin Inhibit Neurite Outgrowth  1292
  Injury-Induced Scarring Hinders Axonal Regeneration  1292
  An Intrinsic Growth Program Promotes Regeneration  1294
  Formation of New Connections by Intact Axons Can Lead to Functional Recovery  1295
Neurons in the Injured Brain Die but New Ones Can Be Born  1296
Therapeutic Interventions May Retain or Replace Injured Central Neurons  1299
  Transplantation of Neurons or Their Progenitors Can Replace Lost Neurons  1299
  Stimulation of Neurogenesis in Regions of Injury May Contribute to Restoring Function  1299

Dif ferentiation of Motor Nerve Terminals Is Organized by Muscle Fibers  1242
Dif ferentiation of the Postsynaptic Muscle Membrane Is Organized by the Motor Nerve  1243
The Nerve Regulates Transcription of Acetylcholine Receptor Genes  1247
The Neuromuscular Junction Matures in a Series of Steps  1247
Central Synapses Develop in Ways Similar to Neuromuscular Junctions  1249
  Neurotransmitter Receptors Become Localized at Central Synapses  1250
  Synaptic Organizing Molecules Pattern Central Nerve Terminals  1252
  Glial Cells Promote Synapse Formation  1253
Some Synapses Are Eliminated After Birth  1254
An Overall View  1257
Selected Readings  1257
References  1257

56 Experience and the Refinement of Synaptic Connections  . . . . . . . . . . . . . . . . . . . . . . . .  1259
Joshua R. Sanes, Thomas M. Jessell
Development of Human Mental Function Is Influenced by Early Experience  1260
  Early Experience Has Lifelong Effects on Social Behaviors  1260
  Development of Visual Perception Requires Visual Experience  1261
Development of Binocular Circuits in the Visual Cortex Depends on Postnatal Activity  1261
  Visual Experience Affects the Structure and Function of the Visual Cortex  1262
  Patterns of Electrical Activity Organize Binocular Circuits in the Visual Cortex  1264
Reorganization of Visual Circuits During a Critical Period Involves Alterations in Synaptic Connections  1267
  Reorganization Depends on a Change in the Balance of Excitatory and Inhibitory Inputs  1268
  Postsynaptic Structures Are Rearranged During the Critical Period  1269
  Thalamic Inputs Are Also Remodeled  1270
  Synaptic Stabilization Contributes to Closing the Critical Period  1272

### Alzheimer Disease Is the Most Common Senile Dementia 1334

The Brain in Alzheimer Disease Is Altered by Atrophy, Amyloid Plaques, and Neurofibrillary Tangles 1335

- Amyloid Plaques Contain Toxic Peptides That Contribute to Alzheimer Pathology 1336
- Neurofibrillary Tangles Contain Microtubule-Associated Proteins 1340
- Risk Factors for Alzheimer Disease Have Been Identified 1341

Alzheimer Disease Can Be Diagnosed Well but Available Treatments Are Poor 1341

Overall View 1343

Selected Readings 1345

### Part IX Language, Thought, Affect, and Learning 60

#### 60 Language 1353

- Patricia K. Kuhl, Antonio R. Damasio
- Language Has Many Functional Levels: Phonemes, Morphemes, Words, and Sentences 1354
- Language Acquisition in Children Follows a Universal Pattern 1355
- The “Universalist” Infant Becomes Linguistically Specialized by Age 1 Year 1356
- Language Uses the Visual System 1357
- Prosodic Cues Assist Learning of Words and Sentences 1358
- Infants Use Transitional Probabilities to Identify Words in Continuous Speech 1359
- There Is a Critical Period for Language Learning 1359
- “Motherese” Enhances Language Learning 1360

#### Several Cortical Regions Are Involved in Language Processing 1360

- Language Circuits in the Brain Were First Identified in Studies of Aphasia 1360
- The Left Hemisphere Is Specialized for Phonetic, Word, and Sentence Processing 1360
- Prosody Engages Both Right and Left Hemispheres Depending on the Information Conveyed 1361
- Language Processing in Bilinguals Depends on Age of Acquisition and Language Use 1361
The Symptoms of Schizophrenia Can Be Grouped into Positive, Negative, and Cognitive 1390
Schizophrenia Is Characterized by Psychotic Episodes 1390
Both Genetic and Nongenetic Risk Factors Contribute to Schizophrenia 1391
Neuroanatomic Abnormalities May Be a Causative Factor in Schizophrenia 1393
Loss of Gray Matter in the Cerebral Cortex Appears to Result from Loss of Synaptic Contacts Rather Than Loss of Cells 1393
Abnormalities in Brain Development During Adolescence May Contribute to Schizophrenia 1395
Antipsychotic Drugs Act on Dopaminergic Systems in the Brain 1397
An Overall View 1399
Selected Readings 1399

63 Disorders of Mood and Anxiety . . . . . . . . . . . . . . . . 1402
Steven E. Hyman, Jonathan D. Cohen

The Most Common Disorders of Mood Are Unipolar Depression and Bipolar Disorder 1403
Unipolar Depression Often Begins Early in Life 1403
Bipolar Disorder Includes Episodes of Mania 1405
Mood Disorders Are Common and Disabling 1405
Both Genetic and Nongenetic Risk Factors Play an Important Role in Mood Disorders 1405
Specific Brain Regions and Circuits Are Involved in Mood Disorders 1406
Depression and Stress Are Interrelated 1407
Major Depression Can Be Treated Effectively 1410
Antidepressant Drugs Target Monoaminergic Neural Systems 1410
Psychotherapy Is Effective in the Treatment of Major Depression 1416
Electroconvulsive Therapy Is Highly Effective Against Depression 1416
Bipolar Disorder Can Be Treated with Lithium and Several Drugs Initially Developed as Anticonvulsants 1416
Anxiety Disorders Stem from Abnormal Regulation of Fear 1418
Anxiety Disorders Have a Genetic Component 1420
Animal Models of Fear May Shed Light on Human Anxiety Disorders 1420
Appendices

A Review of Basic Circuit Theory. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 1525
Steven A. Siegelbaum, John Koester

Basic Electrical Parameters 1525
Potential Difference (V or E) 1525
Current (I) 1525
Conductance (g) 1526
Capacitance (C) 1526

Rules for Circuit Analysis 1527
Conductance 1528
Current 1528
Capacitance 1529
Potential Difference 1529

Current in Circuits with Capacitance 1530
Circuit with Capacitor 1530
Circuit with Resistor and Capacitor in Series 1530
Circuit with Resistor and Capacitor in Parallel 1530

B The Neurological Examination of the Patient................................. 1533
Arnold R. Kriegstein, John C.M. Brust

Mental Status 1533
Alertness and Attentiveness 1533
Behavior, Mood, and Thought 1533
Orientation and Memory 1534
Cognitive Abilities 1534
Language Disorders 1534

Cranial Nerve Function 1536
Olfactory Nerve (Cranial N. I) 1536
E Neural Networks .................. 1581
Sebastian Seung, Rafael Yuste

Early Neural Network Modeling  1582

Neurons Are Computational Devices  1583
  A Neuron Can Compute Conjunctions
  and Disjunctions  1583
  A Network of Neurons Can ComputeAny Boolean
  Logical Function  1585

Perceptrons Model Sequential and Parallel Computation
in the Visual System  1585
  Simple and Complex Cells Could Compute
  Conjunctions and Disjunctions  1586
  The Primary Visual Cortex Has Been Modeled As a
  Multilayer Perceptron  1588
  Selectivity and Invariance Must Be Explained by Any
  Model of Vision  1588
  Visual Object Recognition Could Be Accomplished by
  Iteration of Conjunctions and Disjunctions  1589

Associative Memory Networks Use Hebbian Plasticity to
Store and Recall Neural Activity Patterns  1592
  Hebbian Plasticity May Store Activity Patterns by
  Creating Cell Assemblies  1592
  Cell Assemblies Can Complete Activity Patterns  1594
  Cell Assemblies Can Maintain Persistent
  Activity Patterns  1595
  Interference Between Memories Limits Capacity  1596
  Synaptic Loops Can Lead to Multiple Stable
  States  1596
  Symmetric Networks Minimize Energy-Like
  Functions  1597
  Hebbian Plasticity May Create Sequential
  Synaptic Pathways  1598

An Overall View  1599

Selected Readings  1599

References  1599

F Theoretical Approaches to Neuroscience:
Examples from Single Neurons to
Networks .................. 1601
Laurence F. Abbott, Stefano Fusi, Kenneth D. Miller

Single-Neuron Models Allow Study of the
Integration of Synaptic Inputs and Intrinsic
Conductances  1602
  Neurons Show Sharp Threshold Sensitivity to the
  Number and Synchrony of Synaptic Inputs in Quiet
  Conditions Resembling In Vivo  1602
  Neurons Show Graded Sensitivity to the Number and
  Synchrony of Synaptic Inputs in Noisy Conditions
  Resembling In Vitro  1604
  Neuronal Messages Depend on Intrinsic Activity and
  Extrinsic Signals  1605

Network Models Provide Insight into the Collective
Dynamics of Neurons  1605
  Balanced Networks of Active Neurons Can Generate the
  Ongoing Noisy Activity Seen In Vivo  1605
  Feed-forward and Recurrent Networks Can Amplify or
  Integrate Inputs with Distinct Dynamics  1608
  Balanced Recurrent Networks Can Behave Like
  Feed-forward Networks  1609
  Paradoxical Effects in Balanced Recurrent
  Networks May Underlie Surround Suppression
  in the Visual Cortex  1611
  Recurrent Networks Can Model Decision-making  1612
